

# Ahh-Some®

## Ahh-Some Water Clarifier & Bio-Cleaner

Ahh-Some Water Clarifier & Bio-Cleaner can be added to your pool at any time, whether it's in use or not. There is no need to wait (to swim) after its use. If using Ahh-Some Water Clarifier & Bio-Cleaner for the first time, you will be astonished at how easy it is to use, and how hard it works to keep your pool looking great and your water chemistry in balance. And, one 6-ounce jar treats 12-15,000 gallons for 4 weeks! Follow the instructions below for best results:

- First, check the pH and total alkalinity (TA). Adjust the pH to between 7.4-7.8 and get the TA (total alkalinity) between 80-120 PPM. Ahh-Some Water Clarifier & Bio-Cleaner is a buffered product and will always try to keep your water balanced, based on the initial parameters at the time of its introduction.
- **Add Ahh-Some Water Clarifier & Bio-Cleaner to the water, at the rate of 1 ounce per 2,500 gallons of water every 4 weeks (28 days).** Add a little more in very hot and humid conditions if needed. Just scoop it out with your hand and place it in the pool proper or the skimmer. If your tile line or vinyl border is dirty, rub the Gel into those areas to clean it. Ahh-Some Water Clarifier & Bio-Cleaner will break into smaller clumps and fully dissolve in minutes. You will see a small amount of foam as you add it. If you are using chlorine as a maintenance sanitizer you **MUST** add a shock treatment at the same time Ahh-Some Water Clarifier & Bio-Cleaner is added. We recommend 1 lb. of granular shock for every 6 oz. container. If you have access to liquid chlorine, add 1 gallon for every 6 oz. container of Ahh-Some Water Clarifier & Bio-Cleaner. If you typically use a non-chlorine shock, this is ok, too. Note: It is typical for your free available chlorine (FAC) level to drop after using the Ahh-Some Water Clarifier & Bio-Cleaner. This is normal. Watch the free available chlorine closely for up to 48 hours after adding the Ahh-Some Bio-Cleaner/clarifier.
- We recommend that you maintain a minimum of 1.5 PPM of Free Available Chlorine (FAC) for best results. In hot and humid environments where the pool gets high bather loads, you may wish to maintain a higher FAC, (free available chlorine) level.
- Don't forget to add Ahh-Some Water Clarifier & Bio-Cleaner every 4 weeks. If you forget to add it, you'll see a rapid decline in water clarity. If you add it on schedule, your water will be the freshest, cleanest and highest quality water that you've ever experienced. Ahh-Some Water Clarifier & Bio-Cleaner should reduce your overall maintenance chemical costs. The clarity and brilliance of your pool water should be the best ever. It also enhances your filter's ability to filter finer particulates and contaminants.

# SPECIAL NOTES

## About Ahh-Some Water Clarifier & Bio-Cleaner:

- 1. Ahh-Some Water Clarifier & Bio-Cleaner is guaranteed to work in any pool, no matter what type of sanitizer is used. Great for salt water pools and will help clean biofilm from electrolytic cell plates allowing your salt generator to work more efficiently. Plus, the salt cell will be constantly cleaned of biofilm build-up, giving it a longer life.**
- 2. Ahh-Some Water Clarifier & Bio-Cleaner is not a sanitizer.** You must still maintain adequate levels of sanitizer in your pool at all times.
- 3. If you use a cartridge or element filter, we recommend that you hose it (them) off before you add the Ahh-Some Water Clarifier & Bio-Cleaner.** After this, put it (them) back in your filter and add Ahh-Some Water Clarifier & Bio-Cleaner. Your cartridges or elements will be cleaned thoroughly because of Ahh-Some Water Clarifier & Bio-Cleaner's surfactant qualities. With a sand or DE filter, we recommend that you backwash the filter a day or so after starting with this program.
- 4. Ahh-Some Water Clarifier & Bio-Cleaner can be used in all pool surfaces.**
- 5. Ahh-Some Water Clarifier & Bio-Cleaner can be used with any and every sanitizing program on the market.**

## Quick Step by Step Instructions *at a Glance*

### SWIMMING POOLS

Treat with Ahh-Some every 3-4 weeks.

1. Adjust pH to 7.4-7.8.
2. Adjust Total Alkalinity to 80-120 ppm (parts per million)
3. Shock Pool with your typical sanitizer or non-chlorine shock. NOTE: Chlorine demand may temporarily increase immediately after Ahh-Some treatment due to release of contaminants from pipes and pool surfaces into pool water. Watch closely for 48 hours.
4. Add Ahh-Some at rate of 1oz/2500 gallons directly into pool water in front of inlets or directly into skimmer basket. Unlike spas, tubs, etc. swimming pools will not usually display physical debris coming from the inlets. Your evidence that Ahh-Some Pool Water Clarifier and Bio-Cleaner is working will come from better looking and feeling water. Ahh-Some performs better and faster than most other clarifier's available while dislodging biofilm buildup from the plumbing. We not only clear cloudy water-we keep it clear because we help eliminate bio-film (bacterial build-up). When dislodged, these contaminants are brought into the pool water where sanitizers can eliminate them. TIP: Indoor pools will usually display a vastly improved smell. Scum line on tile and vinyl liner pattern will be gently cleaned 24/7 taking away the unsightliness of the grease and grime look.
